

BAB III

ANALISIS PEMBEBANAN

A. Tinjauan Umum

Analisis struktur atau perhitungan mekanika akibat gaya-gaya dalam portal struktur ini dibantu dengan program komputer. Beban yang diperhitungkan adalah beban tetap dan beban sementara. Beban tetap adalah hasil dari penjumlahan beban mati dengan beban hidup yang telah direduksi yaitu 1,2 beban mati ditambah dengan 1,6 beban hidup seperti yang tercantum menurut SKSNI 3.2.2. Sedangkan beban sementara merupakan penjumlahan beban tetap dengan beban angin, beban tetap dengan beban gempa, beban tetap dengan beban khusus. Pada perencanaan hitungan gempa, digunakan ketentuan dan peraturan yang diambil dari Peraturan Perencanaan Tahap Gempa Indonesia Untuk Gedung 1983 dengan daktilitas penuh seperti yang terdapat dalam SKSNI T-15-1991-03.

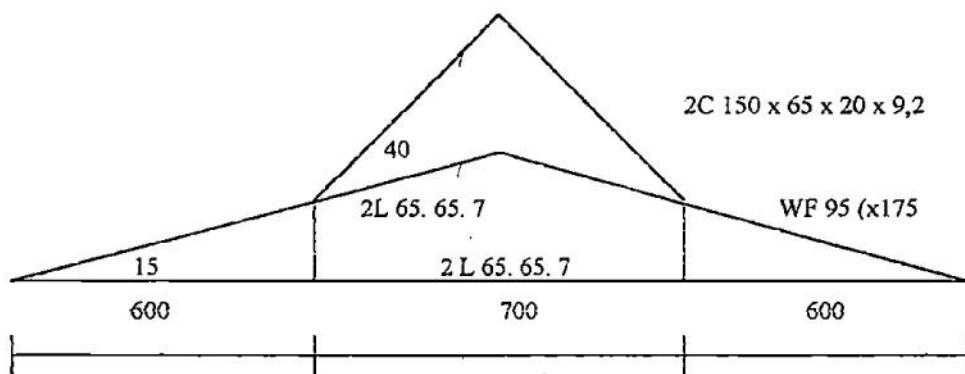

Dalam menganalisis struktur portal di dalam Tugas Akhir ini penyusun di dalam melakukan analisis atau menentukan pembebanan yaitu pembebanan akibat beban mati dan akibat pembebanan beban hidup. Penyusun langsung menggabungkan atau menjumlahkan pembebanan beban mati dan pembebanan beban hidup sesuai dengan peraturan SKSNI 3.2.2. Selanjutnya didalam menentukan beban titik yang bekerja pada kolom lantai atap, penyusun dalam menentukannya berdasarkan pada beban vertikal yang bekerja pada konstruksi kuda-kuda atau konstruksi atap, dengan cara mencari reaksi yang bekerja pada dua tumpuan yang dimisalkan sebagai tumpuan A dan B. Untuk beban tembok dan talang dijadikan beban merata yang bekerja pada elemen balok yang menerima

beban tembok ataupun beban talang, sedangkan beban tangga dijadikan beban yang di SHELL yang bekerja pada struktur yang merupakan fasilitas program SAP- 90.

B. Beban-beban yang Bekerja pada Konstruksi Kuda-kuda

Pembebanan yang digunakan dalam analisis struktur kuda-kuda adalah menurut Peraturan Pembebanan Indonesia Untuk Gedung 1983.

1. Analisis Beban yang Bekerja

Gambar 3.1. Rangka Kuda-kuda

Perhitungan gording

Beban-beban yang berpengaruh pada gording

- muatan mati : Berat sendiri + penutup atap
- muatan hidup : Beban terpusat akibat pekerja
- muatan angin : Angin tekan dan atau angin hisap

Data gording

Digunakan gording : C 150 x 65 x 20 x 3,2

Dari daftar diperoleh : $W_x = 44,3 \text{ cm}^3$

$W_y = 12,2 \text{ cm}^3$

$$F = 9,567 \text{ cm}^2$$

$$I_x = 332 \text{ cm}^4$$

$$I_y = 53,8 \text{ cm}^4$$

$$q = 7,51 \text{ kg/m}$$

Panjang kuda-kuda : 19 m

Penutup atap : Genteng beton ex diamond
berat sendiri 50 kg/m^2

Kemiringan atap : $\alpha_1 = 15^\circ$
 $\alpha_2 = 55^\circ$

Jarak gording : $1000 \text{ mm} = 1 \text{ m}$

Jarak kuda-kuda : $300 \text{ cm} = 3 \text{ m}$

Pembebanan

a. Muatan mati

Berat sendiri gording : $7,51 \text{ kg/m}$

Berat penutup atap : $1 \times 50 = 50,00 \text{ kg/m}$
 $q = 57,51 \text{ kg/m}$

Berat tak terduga 10 % $57,51 = 5,751 \text{ kg/m}$

Total = $63,251 \text{ kg/m}$

b. Muatan hidup

Berat muatan hidup : 100 kg/m

c. Muatan angin (Yogyakarta) $qa = 25 \text{ kg/m}^2$

Angin tekan (W_1) = $(0,02 \times \alpha - 0,4) \times qa \times a \times L$

$(\alpha_1 = 15^\circ)$ ($W_1 a = (0,02 \cdot 15 - 0,4) \cdot 25 \cdot (6/\cos 15) \cdot 3 \cdot (1/2)$)

$$= -23,30 \text{ kg}$$

$$(\alpha_2 = 55) \quad (W_1 b = (0,02 \cdot 55 - 0,4) \cdot 25 \cdot (3,5/\cos 55) \cdot 3 \cdot (1/2)) \\ = 160,20 \text{ kg}$$

$$\text{Angin hisap } (W_2) = -0,4 \times q_a \times a L$$

$$(\alpha_1 = 15) \quad W_2 a = -0,4 \cdot 25 \cdot (6/\cos 15) \cdot 3 \cdot (1/2) = -93,18 \text{ kg}$$

$$(\alpha_2 = 55) \quad W_2 b = -0,4 \cdot 25 \cdot (3,5/\cos 55) \cdot 3 \cdot (1/2) = -91,53 \text{ kg}$$

Didalam perhitungan portal untuk mencari beban titik (beban vertikal) pada portal, maka beban angin tidak diperhitungkan, untuk selanjutnya beban angin diabaikan.

d. Muatan air hujan

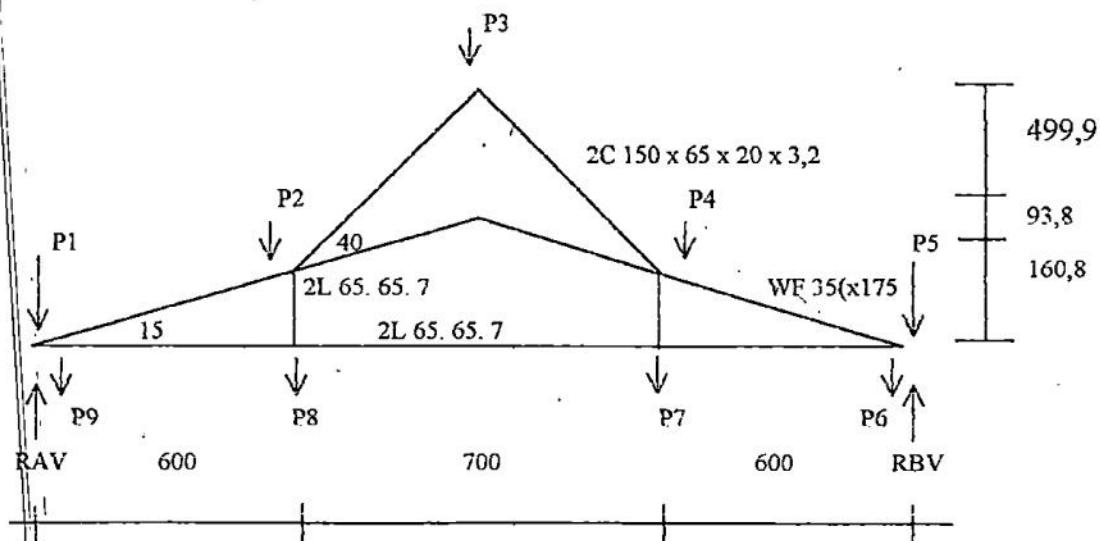

$$\text{Beban air hujan } (\alpha_1 = 15) = 40 - 0,8 \times 15 = 28 \text{ kg/m} > 20$$

$$\text{maka digunakan} = 20 \text{ kg/m}$$

karena $\alpha > 50$ ($\alpha_2 = 55$) = tidak perlu ditinjau

$$\text{Untuk permeter} = 20 \text{ kg/m}$$

2. Perhitungan Konstruksi Kuda-kuda

Gambar 3.2. Gaya-gaya yang Bekerja pada Rangka Kuda-kuda

Analisis beban akibat beban vertikal

Untuk nilai gaya

- a. beban hujan 20 kg/m

menurut Peraturan Pembebanan Indonesia, atap dengan kemiringan $55^0 > 50^0$ maka beban hujan tidak berpengaruh.

$$P_1 = P_2 = P_4 = P_5 = (20 \times 0,5 \times 5) \times 6/\cos 15 = 186,35 \text{ kg}$$

- b. beban atap 50 kg/m

$$P_1 = P_5 = (50 \times 0,5 \times 3) \times 6/\cos 15 = 465,87 \text{ kg}$$

$$P_2 = P_4 = 50 \times 3 \times \{(0,5 \times 6/\cos 15) + (0,5 \times 3,5/\cos 55)\} = 923,529 \text{ kg}$$

$$P_3 = 50 \times 3 \times (3,5/\cos 55) = 915,31 \text{ kg}$$

- c. beban hidup 100 kg

$$P_1 = P_2 = P_3 = P_4 = P_5 = 100 \text{ kg}$$

- d. berat sendiri kuda-kuda

$$\text{batang atas } 2C 150 \times 65 \times 20 \times 3,2 = 15 \times (2 \times 3,5/\cos 55) = 183,062 \text{ kg}$$

$$\text{batang atas WF } 350 \times 175 = 41,4 \times (2 \times 9,5/\cos 15) = 814,348 \text{ kg}$$

$$\text{batang bawah } 2L 65.65.7 = (6,83 \times 19) \times 2 = 259,540 \text{ kg}$$

$$\text{batang vertikal } 2L 65.65.7 = 6,83 \times 6 \tan 15 \times 2 \times 2 = \underline{\underline{43,922 \text{ kg}}}$$

$$\text{total berat sendiri kuda-kuda} = 1.300,872 \text{ kg}$$

$$\text{berat lain-lain diperkirakan } 20\% = \underline{\underline{260,174 \text{ kg}}}$$

$$\text{berat total} = 1.561,046 \text{ kg}$$

jadi nilai untuk

$$P_1 = P_5 = (1561,046/19) \times 6/2 = 246,481 \text{ kg}$$

$$P_2 = P_4 = (1561,046/19) \times \{(6/2) + (3,5/2)\} = 390,262 \text{ kg}$$

$$P_3 = (1561,046/19) \times 3,5 = 287,561 \text{ kg}$$

Cek berat sendiri kuda-kuda

$$P_1 + P_2 + P_3 + P_4 + P_5 = 1561,046 \text{ kg ok!}$$

e. Berat gording C $150 \times 65 \times 20 \times 3,2$ $q = 7,51 \text{ kg/m}$

$$P_1 = P_5 = (7 \times 7,51/2) \times 3 = 78,855 \text{ kg}$$

$$P_2 = P_3 = P_4 = 7 \times 7,51 \times 3 = 157,710 \text{ kg}$$

f. Berat plafon

$$\text{penggantung} = 7 \text{ kg/m}^2$$

$$\text{eternit} = \underline{11 \text{ kg/m}^2}$$

$$q = 18 \text{ kg/m}^2$$

$$P_6 = P_9 = 18 \times 6 \times 3 \times 0,5 = 162 \text{ kg}$$

$$P_7 = P_8 = 18 \times \{(6+7)/2\} \times 3 = 351 \text{ kg}$$

Jadi nilai total gaya

$$P_1 = 186,35 + 465,87 + 100 + 246,481 + 78,855 = 1068,56 \text{ kg}$$

$$P_2 = 186,35 + 923,529 + 100 + 390,262 + 157,71 = 1757,85 \text{ kg}$$

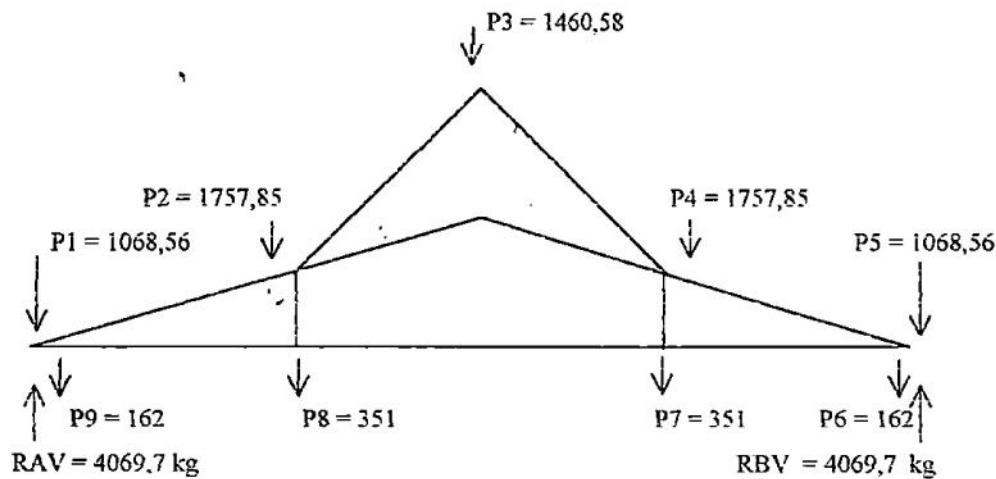

$$P_3 = 915,31 + 287,561 + 100 + 157,71 = 1460,58 \text{ kg}$$

$$P_4 = P_2 = 1757,85 \text{ kg}$$

$$P_5 = P_1 = 1068,56 \text{ kg}$$

$$P_6 = P_9 = 162 \text{ kg}$$

$$P_7 = P_8 = 351 \text{ kg}$$

Maka q kombinasi pembebanan (menurut PBBI 1971 N1-2 P3.3.10. atau SKSNI 3.2.2)

$$1) \ q_a = 1,2 \ WD + 1,6 WL = 8,464 \text{ kN/m}^2 = 846,4 \text{ kg/m}^2 = 0,8464 \text{ t/m}^2$$

$$2) \ q_b = 1,2 \ WD + 1,6 WL = 9,040 \text{ kN/m}^2 = 904,0 \text{ kg/m}^2 = 0,9040 \text{ t/m}^2$$

$$3) \ q_c = 1,2 \ WD + 1,6 WL = 9,904 \text{ kN/m}^2 = 990,4 \text{ kg/m}^2 = 0,9904 \text{ t/m}^2$$

$$5) \ q_e = 1,2 \ WD + 1,6 WL = 8,824 \text{ kN/m}^2 = 882,4 \text{ kg/m}^2 = 0,8824 \text{ t/m}^2$$

$$6) \ q_f = 1,2 \ WD + 1,6 WL = 11,128 \text{ kN/m}^2 = 1112,8 \text{ kg/m}^2 = 1,1128 \text{ t/m}^2$$
